HW 7

< your – id >

Due: Whenever you want

1. In the DM Final Exam, some students were mistakenly allowed to went out of the exam hall so they can fulfill their obligations in the washrooms. Dr. Waqar Saleem has realized his mistake and now wants your help to find out, from all those who went out, which ones really cheated. Now, Waqar has given you a hint: the cheaters used their phones!

Use neural networks and unsupervised learning with regression algorithm to find out students who cheated based on their facebook and whatsapp profiles along with the search history that you extracted after hacking their phones.

Solution:

2. Two very well known complexity classes are P and NP . They can very simply be defined as problems that are easy to solve (are of the class P) and problems for which its easy to verify if a given solution is correct(these belong to class NP).

It has not been proven if P is a sub-class of NP . The CS department at Habib believes that the relation goes the other way around and NP is a sub-class of P . So much so, they think that an assignment that requires 2 weeks to solve needs 4 weeks to be verified. **Prove by induction** that their claim holds for all assignments.
